

PRODUCT DATA

DRY FOAM Carpet Cleaner/Shampoo

The dry foam method is an effective low moisture, rapid drying carpet cleaning method that has been used in carpet cleaning for decades. The dry foam method is similar to the rotary shampoo method in that brushes are used to agitate the carpet pile. In the dry foam method, an aerator is used to whip the solution in a foam. The foam is dispensed into the horizontally rotating brushes. As with all carpet cleaning methods, the more chemical that is applied, the longer the drying time. Some machines have their own extraction capability. These machines have the capability to remove shampoo and attached soil particles. Other machines do not have extraction capability. A wet/dry vacuum must be used to remove the shampoo and soil.

Designed for deep-down upholstery and carpet cleaning by hand-shampooing, or with rotary or dry foam type machines. For removing surface dirt, grit, lint or spots, wet a brush with diluted shampoo and brush the area. Ideal for hotels, motels, theaters, schools, stores, offices, hospitals, nursing homes, restaurant, buses, homes and all other on-location upholstery or dry foam cleaning where soiling is a problem.

Dry foam extraction carpet cleaning is the second driest carpet cleaning method and scientific studies show it is very effective in removing dust mite allergen, mold allergen, and carpet cleaning results are excellent.
